

# Task 1 and Task 2 Results Report

Growth-machine execution, proposal experiment, SuperDocs evidence, and submission readiness

Evidence compilation

15 August 2026

**Executive finding.** Task 1 produced a reproducible, draft-only growth-machine run through n8n: eight inputs produced eight drafts, with zero sends, zero claim-check failures, and zero risk-flagged rows. Task 2 then used the dominant Task 1 document-pain category—customer proposals—to test a section-ranking and targeted-revision workflow in SuperDocs. The experiment captured a genuine instruction-following failure, a successful constrained retry, a defensible but imperfect ranking, and a reviewed Timeline edit with tracked changes.

| Report scope         | Evidence compiled                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Task 1               | n8n setup, recorded metrics, output artifacts, safety gates, and document-pain distribution.                                    |
| Task 2 artifact      | Detailed synthetic Atlas Field Systems proposal and its connection to the Task 1 audience insight.                              |
| SuperDocs experiment | Initial failures, document-integrity comparison, constrained ranking, proposed Timeline revision, and accepted tracked changes. |
| Readiness            | What is complete, what the evidence supports, limitations, and exact remaining actions.                                         |

This report distinguishes observed facts from interpretations. It does not claim outreach results, customer outcomes, or final exported-document integrity that have not been directly verified.

## 1 Evidence basis and verification levels

The compilation uses three evidence levels so that screenshots, repository artifacts, and interpretations are not blended together.

| Level                      | Status label                  | Meaning in this report                                                                                                 |
|----------------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Repository verified</b> | <b>Verified</b>               | A local file, metric, output directory, or normalized text comparison was inspected directly.                          |
| <b>Screenshot served</b>   | <b>ob- Partially verified</b> | The submitted screenshot visibly supports the stated UI event, but does not independently prove the entire final file. |
| <b>Not yet supplied</b>    | <b>Pending</b>                | A final export, complete post-edit text, or public URL is still required before the corresponding claim can be closed. |

Sources inspected include the Task 1 metrics and summaries, the Task 1 audience and measurement documents, the original 1,910-word proposal source, the text pasted back from SuperDocs, and screenshots supplied during the experiment.

## 2 Task 1: n8n growth-machine result

### 2.1 Initial workflow issue and resolution

The imported n8n template initially failed with:

```
Unrecognized node type: n8n-nodes-base.executeCommand
```

The node identifier in the workflow was correct. The cause was n8n 2.x secure-by-default behavior: Execute Command is disabled unless the self-hosted instance explicitly enables it. A local Docker setup was added that:

- sets `NODES_EXCLUDE=""` for the trusted local instance;
- installs Python 3 inside the n8n image;
- mounts the Task 1 project at `/files/task-1-growth-machine`; and
- persists n8n account and workflow data in a Docker volume.

Docker Desktop was initially stopped, producing a missing Linux-engine pipe error. After Docker Desktop was started, the first n8n registry endpoint returned HTTP 429. The base image was switched to the published Docker Hub image, after which the build completed. Runtime checks confirmed n8n 2.0.3, Python 3.12.14, the project mount, and `NODES_EXCLUDE=[]`.

### 2.2 Recorded n8n execution

The repository contains a completed run at `runs/n8n-run-1/`. Its recorded metrics are:

| Metric               | Result          | Interpretation                                   |
|----------------------|-----------------|--------------------------------------------------|
| Batch size           | 8               | Eight synthetic prospect rows were accepted.     |
| Drafts written       | 8               | Completion rate was 100%.                        |
| Emails sent          | 0               | Draft-only safety boundary held.                 |
| Claim-check failures | 0               | No final draft failed the product-claim checker. |
| Rows with risk flags | 0               | No accepted row retained a recorded risk flag.   |
| Generator            | 8 deterministic | The run used reproducible non-LLM generation.    |

**Verified** The n8n execution created a batch snapshot, `metrics.json`, `results.json`, `SUMMARY.md`, and eight Markdown drafts. The run records `send_mode=false` and `emails_sent=0`.

## 2.3 Document-pain distribution

The n8n run classified the eight rows as follows:

| Document pain          | Count | Share of run |
|------------------------|-------|--------------|
| Customer proposal      | 4     | 50.0%        |
| Security questionnaire | 1     | 12.5%        |
| Investor update        | 1     | 12.5%        |
| Policy pack            | 1     | 12.5%        |
| Launch one-pager       | 1     | 12.5%        |

Across the two canonical Task 1 runs, customer proposals accounted for 7 of 16 rows, or 43.75%. This is the strongest empirical connection between Task 1 and the Task 2 proposal experiment. It is an offline input-distribution result, not a customer-response metric.

## 2.4 What Task 1 does and does not prove

Task 1 proves that the machine can validate structured inputs, generate draft-only messages, apply its safety and claim checks, and preserve reproducible evidence. It does not prove opens, replies, meetings, revenue, or market demand because no messages were sent and outreach was prohibited.

# 3 Task 2 artifact: synthetic detailed proposal

## 3.1 Artifact created

The Task 2 test document is a detailed, synthetic proposal titled *Workflow Modernization Proposal*, prepared for the fictional Atlas Field Systems operations team by the fictional Northstar Workflow Studio. The source and upload-ready file are:

- `atlas-field-systems-proposal.md`;
- `atlas-field-systems-detailed-proposal.docx`.

The proposal contains 1,910 words and includes an executive summary, objectives, current state, a three-phase approach, six deliverables, roles and responsibilities, working principles, a six-week

Timeline, acceptance criteria, assumptions, scope boundaries, risks, change control, pricing, terms, and next steps.

### 3.2 Controlled content design

The proposal deliberately separates editable business content from protected content. It states that reviewers may edit the operational sections, while Pricing and Terms must remain unchanged. It also prohibits unsupported claims about systems, staffing, volume, compliance, financial impact, and performance.

Protected Pricing text:

**Pricing remains unchanged from the approved template.**

Protected Terms text:

**This proposal does not modify the legal terms in the approved template. Any change to scope, timeline, pricing, or legal terms requires written approval from both parties.**

### 3.3 Connection to Task 1

The proposal is *informed by*, but not itself produced by, Task 1. Task 1 identified customer proposals as the most frequent document-pain category in both the recorded n8n run and the two canonical batches. Task 2 operationalizes that insight through a realistic proposal-editing test.

The Atlas Field Systems inspection scenario is synthetic. It must not be described as a Task 1 research finding or a real customer result. The defensible narrative is that Task 1 selected the problem category, while Task 2 supplied a controlled document for evaluating section precision, review, protected clauses, and export.

## 4 SuperDocs experiment chronology

### 4.1 Experiment goal

The selected evaluation behavior was: rank proposal sections against an approval goal, identify the weakest section, and improve only that section without changing protected content. The approval goal was to make the proposal concise, credible, and easy for an operations buyer to approve.

### 4.2 Attempt 1: broad ranking request did not complete

The first prompt requested a ranking of every section, grounded in specific evidence, with no edits. Submitted screenshots showed extended progress messages, followed by a response saying the system could not assemble a safe answer and asking the user to rephrase. A repeat produced additional progress statements but no ranking.

When asked for a summary of changes, the system then described numerous alleged revisions—including a revised title block, tightened objectives, expanded scope controls, and added Timeline—even though no before/after diff was available in that turn.

**Observed failure:** the system did not fulfill the analysis-only ranking request and later described changes that had not occurred.

This is useful evidence because it is a genuine instruction-following and state-grounding failure, not a manufactured example.

### 4.3 Document-integrity verification after the failure

The full document text was pasted back from SuperDocs and compared with the original source after normalizing Markdown heading markers, bullet markers, bold markers, and whitespace.

| Comparison            | SuperDocs text | Original source |
|-----------------------|----------------|-----------------|
| Normalized word count | 1,910          | 1,910           |
| Normalized full text  | Identical      |                 |
| Protected Pricing     | Exact match    |                 |
| Protected Terms       | Exact match    |                 |

Therefore, the inaccurate changes summary did not correspond to an actual text mutation at that point. The document remained intact.

### 4.4 Attempt 2: constrained analysis-only retry succeeded

The retry reduced the scope to exactly five named sections, prohibited edits and summaries, required a numbered weakest-to-strongest ranking, and required one text-grounded reason per section.

The resulting ranking was:

| Rank | Section           | Returned rationale                                                                                           |
|------|-------------------|--------------------------------------------------------------------------------------------------------------|
| 1    | Timeline          | Weakest because dates and milestones were described as still to be agreed, making it feel thin for approval. |
| 2    | Executive Summary | Clear and concise, but high-level and cautious in phrasing.                                                  |
| 3    | Next Steps        | Practical and easy to follow, but generic and limited in decision-making substance.                          |
| 4    | Proposed Approach | Structured and credible, with a clear three-phase flow.                                                      |
| 5    | Current State     | Strongest because it names only the confirmed manual-process delay and avoids unsupported claims.            |

**Evaluation of the ranking.** The response followed the constrained output contract and grounded the ordering in the document. Its Timeline rationale was only partly convincing: the source already contained weekly milestones, although exact dates were intentionally deferred. This makes the result useful but not beyond critique—appropriate for an honest build report.

### 4.5 Targeted Timeline revision

SuperDocs was asked to rewrite only the Timeline, preserve the six-week duration and week-by-week activities, add purpose/output/approval points, avoid invented facts, and present the change for review before applying it.

The proposed revision supplied:

- a purpose, output, and approval point for Week 1 discovery;
- validation and sign-off framing for Week 2 requirements;
- operational review for Weeks 3–4 configuration;
- refinement approval for Week 5; and

- final acceptance or documented follow-up for Week 6.

The proposal did not invent calendar dates, costs, systems, performance targets, or customer outcomes. One issue was identified before acceptance: it weakened the original final sentence from a written-agreement control to “would remain unchanged.” The user instructed the system to preserve the original sentence exactly.

#### 4.6 Tracked changes accepted

The final submitted screenshots show a review surface reporting “2 changes reviewed” and “2/2 reviewed,” with both changes marked Accepted. The visible changes include:

- changing the section heading from “Timeline” to “Project Timeline”; and
- rewriting the Timeline introduction into a six-week, stage-based description with clear progress, deliverables, and approval points.

The screenshot also visibly retains the sentence:

**The six-week duration will not change without written agreement from both parties.**

**Partially verified** The UI evidence supports that two displayed Timeline changes were reviewed and accepted. A complete post-edit export or full post-edit text was not supplied, so the report does not claim byte-for-byte integrity for the entire final document after acceptance.

## 5 Results and measurements

| Measure                                 | Result             | Evidence interpretation                                                                              |
|-----------------------------------------|--------------------|------------------------------------------------------------------------------------------------------|
| <b>n8n Task 1 completion</b>            | 8/8 drafts         | Repository-verified 100% completion for <b>n8n-run-1</b> .                                           |
| <b>Outbound sends</b>                   | 0                  | Safety boundary held; no outreach result is claimed.                                                 |
| <b>Claim-check failures</b>             | 0                  | No final n8n-run-1 output failed the claim checker.                                                  |
| <b>Initial broad ranking</b>            | Failed             | No requested ranking; later changes summary was not grounded in an actual diff.                      |
| <b>Constrained five-section ranking</b> | Succeeded          | Returned all five sections in the requested order with reasons.                                      |
| <b>Pre-edit document integrity</b>      | Passed             | Normalized 1,910-word text matched the source exactly.                                               |
| <b>Targeted revision grounding</b>      | Passed in proposal | No unsupported dates, costs, systems, targets, or outcomes were introduced in the proposed Timeline. |
| <b>Tracked-change review</b>            | 2/2 accepted       | Screenshot-observed acceptance of two displayed Timeline edits.                                      |
| <b>Final whole-file verification</b>    | Pending            | Requires the exported final DOCX/PDF or complete final text.                                         |

If the two ranking interactions are treated only as a tiny diagnostic sample, one of two prompts returned the requested ranking. That 50% figure must not be generalized as a product success rate; it is merely a transparent description of this single experiment trail.

## 6 What the evidence supports

### 6.1 Supported conclusions

- The self-hosted n8n control plane can execute the existing Python machine and preserve its no-send safety boundary.
- Customer proposals are the most common document-pain label in the available Task 1 batches.
- A detailed synthetic proposal provides a relevant controlled artifact for testing section-scoped document work.
- The first broad SuperDocs request exposed a real instruction-following and grounding failure.
- A narrower, explicitly structured prompt produced a complete five-section ranking.
- SuperDocs produced a useful targeted Timeline proposal and exposed changes through a review interface.
- The user accepted two visible Timeline changes. The written-agreement duration control remained present.

### 6.2 Unsupported or premature conclusions

- The evidence does not show that every section in the final document remained unchanged after acceptance.
- The evidence does not yet show a verified final DOCX/PDF export with formatting preserved.
- The screenshots do not establish a statistically meaningful reliability rate.
- No real customer, outreach, conversion, revenue, or time-saving outcome was measured.
- The synthetic Atlas Field Systems scenario is not a Task 1 prospect or customer result.

## 7 Build-in-public evidence map

The five-post series can be grounded in the recorded experiment without inventing progress.

| Post | Required role       | Evidence available                                                                                                                                      |
|------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Plan and disclosure | Explain the exact section-critique build, synthetic proposal, approval goal, and candidate disclosure.                                                  |
| 2    | First breakage      | Show the broad ranking request, stalled/safety response, and inaccurate change summary.                                                                 |
| 3    | Decision changed    | Show the narrowed five-section analysis-only contract and explain why scope was reduced.                                                                |
| 4    | Measured result     | Report one failed broad attempt, one successful constrained attempt, 1,910-word pre-edit integrity, and protected clauses unchanged at that checkpoint. |
| 5    | Finished build      | Show the ranked weakest section, proposed Timeline revision, 2/2 accepted changes, and final export after it is verified.                               |

The posts must be published across the required cadence, with actual dates and URLs recorded only after publication. The small diagnostic counts must be framed as this experiment’s evidence, not as general product performance.

## 8 Remaining actions

1. Export the accepted proposal from SuperDocs as DOCX or PDF.
2. Re-open the export and verify the heading hierarchy, lists, pagination, and Timeline presentation.
3. Compare the final Pricing and Terms against the exact protected strings in this report.
4. Confirm that no non-Timeline section changed after acceptance; retain a final text copy or diff as evidence.
5. Capture a clean final screenshot without menus obscuring the edited Timeline.
6. Add the final export name, screenshot locations, and verification result to the build notes.
7. Publish the five-post series over the required cadence and record real URLs.
8. Include a short version of this build in the Task 4 demo; no separate Task 2 video is required.

## 9 Recommended honest completion statement

Task 1 produced a reproducible, draft-only n8n run with eight drafts, zero sends, and zero final claim-check failures. Task 2 used the dominant proposal pain from the Task 1 batches to test a synthetic section-critique workflow in SuperDocs. The first broad ranking request failed and later described changes that had not occurred; a constrained five-section retry succeeded. SuperDocs then proposed a targeted Timeline improvement, and two visible tracked changes were reviewed and accepted while the written-agreement duration control remained present. Final whole-file and export verification remain to be completed before the build is described as finished.

## A Prompts used

### A.1 Successful constrained ranking prompt

Do not edit, rewrite, summarize, or propose changes to the document. Perform analysis only. Review exactly these five sections: Executive Summary, Current State, Proposed Approach, Timeline, and Next Steps. Rank them from 1, weakest, to 5, strongest against this goal: concise, credible, and easy for an operations buyer to approve. For each section, provide one reason grounded in its current wording. End by naming only the weakest section. Do not modify the document.

### A.2 Targeted revision prompt

Rewrite only the Timeline section so it is more decision-ready for an operations buyer. Preserve the six-week duration and the existing week-by-week activities. Clarify the purpose, output, and approval point for each stage. Do not invent calendar dates, costs, systems, performance targets, or customer facts. Do not modify any other section. Pricing and Terms must remain exactly unchanged. Present the proposed Timeline revision for review before applying it.

### A.3 Final correction instruction

Apply this proposed Timeline revision only, but replace the final sentence with the original exact wording: “The six-week duration will not change without written agreement from both parties.” Do not change any other section. Keep Pricing and Terms exactly unchanged.

## B Complete screenshot evidence

This appendix embeds every screenshot supplied for the Task 1 and Task 2 evidence trail. Captions state only what is visible or what is corroborated by repository files.

### B.1 Task 1 setup and execution

Screenshot 1. Imported n8n control-plane template before Execute Command was enabled. The Run Existing Python Machine node appears unresolved.

Screenshot 2. Original runtime error: Unrecognized node type:  
n8n-nodes-base.executeCommand.

Screenshot 3. Successful Task 1 workflow view after the local n8n repair. All five operational nodes display green completion states, with one item passed along the chain.

Screenshot 4. Second submitted successful Task 1 workflow view. The manual trigger, configuration, validation, Python execution, and safety-summary nodes all show successful completion.

The successful canvas views do not expose the final JSON values themselves. The quantitative Task 1 claims in this report come from the separately inspected `runs/n8n-run-1/metrics.json` and associated output files.

## B.2 Task 2 initial failure and inaccurate summary

Screenshot 5. The broad ranking request first returned a safety/rephrase response, then progress statements without the requested ranking.

Screenshot 6. After a request for a full breakdown, SuperDocs began a text summary of alleged current changes despite stating that no before/after diff was available in the turn.

Screenshot 7. Continuation of the inaccurate change summary, including claims about the Timeline, protected Pricing and Terms, and other proposal sections. The subsequent normalized text comparison found no actual textual change at this checkpoint.

### B.3 Task 2 constrained ranking success

Screenshot 8. The constrained five-section retry returned a complete weakest-to-strongest ranking and identified Timeline as the weakest section.

## B.4 Task 2 tracked revision and acceptance

Screenshot 9. In-document tracked revision of the Timeline introduction, showing removed text in red and proposed text in green. The first weekly heading remains visible below the edited paragraph.

Screenshot 10. Review panel showing two reviewed changes, both Accepted: the heading changed from Timeline to Project Timeline, and the Timeline introduction was rewritten.

## C Evidence inventory

| Item                    | Location or status                                                                     |
|-------------------------|----------------------------------------------------------------------------------------|
| n8n run metrics         | task-1-growth-machine/runs/n8n-run-1/metrics.json                                      |
| n8n run summary         | task-1-growth-machine/runs/n8n-run-1/SUMMARY.md                                        |
| n8n drafts              | task-1-growth-machine/outbox/n8n-run-1/                                                |
| Proposal source         | atlas-field-systems-proposal.md in the Task 2 build folder.                            |
| Upload-ready proposal   | atlas-field-systems-detailed-proposal.docx in the Task 2 build folder.                 |
| Pasted pre-edit text    | Submitted in-session; normalized comparison completed.                                 |
| Ranking evidence        | Submitted screenshot and transcript.                                                   |
| Tracked-change evidence | Submitted screenshots showing 2/2 accepted Timeline edits.                             |
| Complete screenshot set | Ten embedded images in the preceding appendix: four Task 1 and six Task 2 screenshots. |
| Final exported proposal | <b>Pending</b>                                                                         |
| Public post URLs        | <b>Pending</b>                                                                         |
